

Railway Industry OEM approved solutions for protecting wheel sets, direct glazing and specialist structural bonding

Corrosion in the railway industry is a well know safety related topic that is costing the industry billions of pounds every year. We produce and sell a number of specialist products to both operators and manufacturers. Our solutions have a proven track record at reducing stone chipping and corrosion on wheel sets. The products when used in combination with the correct paint system, can increase the wheel-set life by up to 50%. Metal shavings and particles from passing wagons are a constant hazard causing shortages on many electrical installations. We produce a clear approved coating that can keep electrical installations free of pollution and weather impacts. The coating also prevents switches from freezing in the winter down to -55°C.

Our technical team and research & development department can work closely with your organisation

DINITROL® UK are the largest corrosion protection coating supplier in the UK sector providing products to many global automotive and industrial manufacturers. We also advise suppliers of OEM plants on packaging and corrosion protection techniques. This ensures they are certified and are able to fulfil the strict packaging standardisation procedures required. The company is an accredited member of iCORR the Institute of Corrosion Protection and also provide full salt spray chamber and climatic chamber corrosion resistance testing services at our UK headquarters.
